RAcE Democratic Republic of Congo Final Evaluation Results

RAcE 2015 Programme
Multi-Country Results Dissemination Meeting
25 October 2017
RAcE Democratic of Congo (DRC) Final Evaluation Results - Overview

- To demonstrate the plausible contribution of the RAcE project to changes in treatment coverage indicators and estimated mortality change, ICF assessed project and district data, estimated the change in child mortality in RAcE project areas using LiST, and documented contextual factors that may have influenced child health in project areas.

- Here we present findings that answer two evaluation questions:
  - Was there a reduction in childhood mortality, and were the lives of children ages 2–59 months saved, in the RAcE project area?
  - What was the RAcE project’s contribution to the estimated changes in mortality?
Summary of Key Evaluation Findings (1)

- Caregivers were aware of and highly valued the services of *Relais Communautaire* (ReCos) likely due to community engagement efforts.

- Care-seeking shifted from health centers to ReCos as first source of care (70% at endline).

- The number of cases treated by ReCos increased substantially over the course of the project, nearly doubling for each illness from Year 2 to Year 3.

- The number, network, and density of ReCos trained and supported contributed to increases in care-seeking and coverage.

- ReCos contributed to the improved assessment of and treatment for malaria, pneumonia, and diarrhea. For example, 76% of fever cases received RDT by all providers; 91% of those managed by ReCo.
Summary of Key Evaluation Findings (2)

- Other projects operating in RAcE Project areas* likely did not have a significant influence on sick child care-seeking and assessment and treatment for diarrhea, malaria, and pneumonia.

- The RAcE project accomplishments are particularly notable in the context of political instability and population displacement, which may have hindered access to facility-based services.

- Communities benefited from iCCM services supported by the RAcE project, but access to health services remains a challenge.

*USAID-funded TRAction and ASSIST projects.
Estimated Change in Child Mortality in RAce DRC Project Areas

- The LiST model estimated results based on the total population in RAce project communities estimated at 1,000,000.
- Estimated change in U5MR in the project area:
  - 18 deaths per 1,000 live births
  - 15 percent decrease in U5MR from 2013 to 2016.

Table 1. Estimated mortality rates modeled in LiST for each project year.

Estimated Lives Saved in RAcE DRC Project Areas

- An estimated total of 1,815 under-five lives saved by pneumonia, diarrhea, and malaria treatment from 2013 to 2016.
- An estimated 1,728 lives were saved due to treatment provided by ReCo.

Table 2. Estimated number of child lives saved per year by treatment interventions in RAcE DRC project areas

LiST Model Limitations

- The accuracy of the model results is limited by the data input to the model.

- LiST does not account for the mode of delivery or source of care (with the exception of facility birth).

- LiST model does not account for changes in diagnostics, the quality of care, timeliness of pneumonia and diarrhea treatment, nor referrals made or completed.
Plausible Contribution of RAcE

- Observed increases in iCCM-related indicators are most likely due to RAcE project interventions.

- The results from this evaluation suggest that it is likely that the RAcE project contributed substantially to the estimated decrease in under-five child mortality between 2013 and 2016.
Conclusion

The LiST model estimates that from 2013 to 2016:

- 15 percent decrease in child mortality in RAcE communities in Tanganyika.
- Net 1,855 lives were saved among children under five
  - 327 lives lost due to decreases or stagnation in intervention coverage
  - 2,182 lives saved due to increases in intervention coverage
- 1,815 under-five lives (83%) saved by pneumonia, diarrhea, and malaria treatment.

ICF concludes that:

- An estimated 1,728 under-five lives were saved (79%) due to ReCo-provided treatment
- It is highly plausible that the RAcE DRC project contributed substantially to the observed mortality reduction, namely, to nearly 80 percent of the estimated total child lives saved.
Acknowledgements

ICF would like to thank the International Rescue Committee and the DRC MOPH for sharing their data, time, thoughts, and experiences in implementing the RAcE project in DRC.

We would also like to thank the ReCo in DRC, who work hard to provide services to caregivers and children in communities, and the caregivers who give so much to ensure and improve the health of their children.

This work was made possible by the WHO through funding by Global Affairs Canada.
Thank You!
